

BIOL 131: THE SCIENCE OF KNOWLEDGE (O)

Understanding the concept of Scientific Knowledge requires an examination of the “simple” questions of “What do we know?” and “How do we know it?” The answers to these two questions have long histories and are very interesting and important. In contemporary times the answers are of greater consequence than ever before. This course explores how we’ve come to develop the facts that we can depend on today. In doing so it will take students on a trip around the globe and to key points in science history.
